

Replication README for STATA code and data. This README file describes the STATA replication files for the paper Jordà and Taylor, “Local projections” as published in *Journal of Economic Literature*.

Notes The replication files are located in the main folder LP_JEL_Replication, which in turn contains a number of subfolders, one for each of the main examples, organized as follows:

Folder name	Output figures shown in the paper
Example1_LongDifferences	Figure1a.pdf, Figure1b.pdf
Example2_Multipliers	Figure2a.pdf, Figure2b.pdf, Figure9a.pdf, Figure9b.pdf
Example3_Smoothing	Figure3.pdf
Example4_LagAugmentation	Figure4.pdf
Example5_SignificanceBands	Figure5a.pdf, Figure5b.pdf
Example6_JointInference	Figure6a.pdf, Figure6b.pdf
Example7_MinimumDistance	Figure7a.pdf, Figure7b.pdf, Figure7c.pdf, Figure7d.pdf
Example8_Counterfactuals	Figure8a.pdf, Figure8b.pdf
Example9_StateDependence	Figure10a.pdf, Figure10b.pdf

The STATA programs rely on various packages which need to be installed for the code to run. If an error message occurs, search for and install the required package. In addition, correct output of the figures requires the fonts Palatino and cmsy10 to be installed. Most do files can be run individually, but some folders also include an all.do file which will run all programs in that folder. Each do file sets the current directory and users will need to amend those lines to point to their own directory path.

For each example, further details explaining the code and data can be found in a README file within each folder.
